Homework 4

Author: Matthew J. Crossley

Last update: 29 April, 2024

Warning and important message

- This homework is still a work in progress. The final state of this homework will be very similar to it's current form, but we will likely adjust or add a bit in the coming week or two.
- Please also note that my earlier warnings that you need to start this homework ages ago to avoid being stressed to the bone in getting it done on time are no longer valid. I have split this homework into two parts. The first part is now HW3 and the second part is HW4. This makes the workload more manageable.

Q1

Consider an investigation into the relationship between the duration of sleep and performance on a memory task. Below is a plot of the data collected, along with the predictions from the best fitting linear model.

`geom_smooth()` using formula = 'y ~ x'

```
##
## Call:
## lm(formula = memory_performance ~ sleep_duration, data = d)
##
## Residuals:
##
       Min
                1Q Median
                               3Q
                                      Max
## -8.4508 -4.0698 -0.5393 3.2803 12.0390
##
## Coefficients:
##
                 Estimate Std. Error t value Pr(>|t|)
## (Intercept)
                  77.8549
                               4.0697
                                        19.13
                                                <2e-16 ***
                               0.5800
                                                0.242
## sleep_duration
                   0.6841
                                        1.18
## Signif. codes: 0 '***' 0.001 '**' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 4.637 on 78 degrees of freedom
## Multiple R-squared: 0.01752,
                                   Adjusted R-squared:
                                                        0.004929
## F-statistic: 1.391 on 1 and 78 DF, p-value: 0.2418
```

• Please write the equation of the best fitting linear model.

• Please list all random variables in the best fitting linear model and state how they are distributed.

•	Please draw a point range plot illustrating the best fittings β coefficients with error bars showing SEM
•	What is Pearson's correlation coefficient between sleep duration and memory performance?
•	Please write a few sentences reporting the results of this analysis.

$\mathbf{Q2}$

Consider a study in which researchers collected data on participants' age and education level and examined how these variables predict performance on a memory task. Below is a plot of the data along with the predictions from the best-fitting multiple regression model.

```
## `geom_smooth()` using formula = 'y ~ x'
## `geom_smooth()` using formula = 'y ~ x'

```

•	Please write the equation of the best fitting linear model.
•	Please list all random variables in the best fitting linear model and state how they are distributed.
•	Please draw a point range plot illustrating the best fittings β coefficients with error bars showing <code>SEM</code>

•	Please draw a boxplot illustrating the residuals of the best fitting linear model. Please set the whiskers to extend to the min and max values. What random variable in your linear model does this plot tell you about?
•	What is Pearson's correlation coefficient between (1) age and memory performance, and (2) education level and memory performance?
•	What is the partial correlation between age and memory performance when controlling for education level?

•	Please write a few sentences reporting the results of this analysis for an academic journal.	
•	Please write R code (using your pen or pencil) that generates the regression analysis reported R	above
